Contents

Foreword **17**

Appendices **18**

A Navigating the ocean of Judea Pearl's Books **19**

B CI-2-3 track **20**

C Notational Conventions and Preliminaries **24**
C.1 Some abbreviations frequently used throughout this book 24
C.2 $\mathcal{N}(!a)$ 24
C.3 Indicator function (a.k.a. Truth function) 24
C.4 One hot vector 25
C.5 L^p norm 25
C.6 Special sets 27
C.7 Kronecker delta function 27
C.8 Dirac delta function 27
C.9 Majority function 27
C.10 Underlined letters indicate random variables 27
C.11 Probability distributions 28
C.12 Discretization of continuous probability distributions 28
C.13 Samples, i.i.d. variables 29
C.14 Expected Value and Variance 29
C.15 Conditional Expected Value 30
C.16 Notation for covariances 30
C.17 Conditional Covariance 31
C.18 Normal Distribution 32
C.19 Uniform Distribution 33
C.20 Softmax function (a.k.a. Boltzmann Distribution) 33
C.21 Sigmoid and log-odds functions 34
C.22 Estimand, Estimator (curve-fit), Estimate, Bias 35
C.23 Maximum Likelihood Estimate, Likelihood Ratio Test 36
C.24 Mean Square Error (MSE) 37
C.25 Cramer-Rao Bound 39

C.26 Bayes Rule, Bayesian Updating And Conjugate Priors 43
C.27 Linear regression, Ordinary Least Squares (OLS) 44
C.27.1 LR, assuming x_σ are non-random 45
Derivation of LR From Minimization of Error 46
Geometry of LR with non-random x_σ. 47
LR Goodness of Fit, R^2 48
C.27.2 LR, assuming x_σ are random 51
Transforming expressions from non-random to random x_σ . . 51
LR with random x_σ, expressed in derivative notation 53
Double regression of y 57
R^2 with random x_σ 59
C.28 Logistic Regression (LoR) 60
C.29 Entropy, Kullback-Leibler divergence, Cross-Entropy 60
C.30 Definition of various entropies used in Shannon Information Theory . 61
C.31 Mean log likelihood asymptotic behavior 62
C.32 Arc Strength (Arc Force) 64
C.33 Pearson Chi-Squared Test 64
C.34 Demystifying Population and Sample Variances 65
C.35 Independence of $\widehat{\mu}$ and $\widehat{\sigma^2}$ 67
C.36 Chi-square distribution 68
C.37 Student's t-distribution 69
C.38 Hypothesis testing and 3 classic test statistics (Likelihood, Score, Wald) 72
C.39 Error Bars 75
C.40 Confidence Interval 76
C.41 Score p-value 78
C.42 Convex/Concave functions, Jensen's Inequality 80
C.43 Chebyshev's inequality 81
C.44 Short Summary of Boolean Algebra 83
C.45 Laplace transform 84
C.45.1 Examples 86
C.45.2 Properties 87
C.46 Z-transform 93
C.46.1 Examples 96
C.46.2 Properties 97
C.47 Legendre Transformation (dual functions) 100
C.47.1 Examples 101
C.47.2 Properties 103
C.47.3 Connection to Fourier transform and Quantum Mechanics . . 106
C.48 Numpy tensor methods 107

D Definition of a Bayesian Network **113**

E Bayesian Networks, Causality and the Passage of Time **117**
E.1 Unifying Principle of this book . . . 117
E.2 You say tomato, I say tomato . . . 118
E.3 A dataset is causal model free . . . 118
E.4 What is causality? . . . 119
E.5 Bayesian Networks and the passage of time . . . 120
E.6 Advice for the DAG-phobic . . . 121

1 AdaBoost **122**
1.1 AdaBoost for general ensemble of w-classifiers . . . 122
1.2 AdaBoost for ensemble of tree stumps . . . 126

2 ANOVA **128**
2.1 Law of Total Variance . . . 128
2.2 Sum of Squares Estimates . . . 129
2.3 F-statistic and hypothesis testing . . . 131

3 ARACNE structure learning **133**

4 Backdoor Adjustment Formula **135**
4.1 Examples . . . 136

5 Back Propagation (Automatic Differentiation) **140**
5.1 Toy Example . . . 140
5.2 General Theory . . . 141
5.2.1 Jacobians . . . 141
5.2.2 Bnets for function composition, forward propagation and back propagation . . . 142
5.3 Application to Neural Networks . . . 144
5.3.1 Absorbing b_i^λ into $w_{i|j}$. . . . 144
5.3.2 Bnets for function composition, forward propagation and back propagation for NN . . . 145
5.4 General bnets instead of Markov chains induced by layered structure of NNs . . . 148

6 Bell and Clauser-Horne Inequalities in Quantum Mechanics **149**

7 Berkson's Paradox **150**

8 Binary Decision Diagrams **152**

9 Chow-Liu Trees and Tree Augmented Naive Bayes (TAN) **156**
9.1 Chow-Liu Trees . . . 156
9.2 Tree Augmented Naive Bayes (TAN) . . . 160

10 Control Theory (linear, deterministic) 162
10.1 Basic feedback model . . . 163
10.2 Classical model (analog) . . . 164
10.3 Modern model (analog) . . . 167
10.4 Classical model (digital) . . . 171
10.5 Modern model (digital) . . . 171
10.5.1 Discretizing derivatives . . . 172
10.5.2 Solving Difference Equation . . . 173
10.6 Higher than first order differential (or difference) equations . . . 175
10.6.1 Differential Equations . . . 175
10.6.2 Difference Equations . . . 176
10.7 Time-Invariance, Causality, Stability . . . 177
10.8 Controllability, Observability . . . 178
10.9 Signal Flow Graph . . . 178

11 Copula 183
11.1 Examples . . . 186

12 Counterfactual Reasoning 189
12.1 The 3 Rungs of Causal AI . . . 189
12.2 Do operator . . . 190
12.3 Imagine operator . . . 190

13 Cross-Validation 194

14 DAG Extraction From Text (DEFT) 197

15 Dataset Shift and Batch Normalization 198
15.1 Covariate Shift . . . 199
15.2 Concept Shift . . . 199
15.3 Batch Normalization . . . 200

16 Decision Trees 201
16.1 Transforming a dtree into a bnet . . . 203
16.2 Structure Learning for Dtrees . . . 204
16.2.1 Information Gain, Gini . . . 205
16.3 Information Gain Ratio . . . 208
16.3.1 Pseudo-code . . . 209

17 Decisions Based on Rungs 2 and 3: COMING SOON 211

18 Difference-in-Differences **212**
18.1 John Snow, DID and a cholera transmission pathway 212
18.2 PO analysis 214
18.3 Linear Regression 216

19 Diffusion Models **219**
19.1 Bnet for DM 219
19.2 Mean Values $M^{t-1}(x^t)$ and $M_\theta^{t-1}(x^t)$ 222
19.3 Loss function $\mathcal{L}$ 225
19.4 Algorithms for training and sampling DM 227

20 Digital Circuits **229**
20.1 Mapping any dcircuit to a bnet 229
20.1.1 Option A of Fig.20.2 229
20.1.2 Option B of Fig.20.2 230

21 Do Calculus **231**
21.1 3 Rules of Do Calculus 234
21.2 Parent Adjustment Formula 235
21.3 Backdoor Adjustment Formula 237
21.4 Frontdoor Adjustment Formula 238
21.5 Comparison of Backdoor and Frontdoor adjustment formulae 239
21.6 Do operator for DEN diagrams 240

22 Do Calculus proofs **243**

23 D-Separation **261**

24 D-Separation in Quantum Mechanics **264**

25 Dynamical Bayesian Networks **265**

26 Expectation Maximization **267**
26.1 The EM algorithm: 268
26.1.1 Motivation 269
26.2 Minorize-Maximize (MM) algorithms 269
26.3 Examples 271
26.3.1 Gaussian mixture 271
26.3.2 Blood Genotypes and Phenotypes 272
26.3.3 Missing Data/Imputation 274

27 Factor Graphs **275**

28 Frisch-Waugh-Lovell (FWL) theorem **278**
28.1 FWL, assuming x^σ are non-random . . . 278
28.2 FWL, assuming x^σ are random . . . 279

29 Frontdoor Adjustment Formula **281**
29.1 Examples . . . 282

30 G-formula (Sequential Backdoor Adjustment Formula) **283**

31 Gaussian Nodes with Linear Dependence on Parents **287**

32 Generalized Linear Model (GLM) **290**
32.1 Exponential Family of Distributions . . . 290
32.2 GLM . . . 292

33 Generative Adversarial Networks (GANs) **297**

34 Goodness of Causal Fit **302**

35 Gradient Descent **303**

36 Granger Causality **305**

37 Hidden Markov Model **308**
37.1 Calculating $P(x_t, v^n)$ and $P(x_t, x_{t+1}, v^n)$ . . . 310
37.2 Calculating $\mathcal{F}_t$ and $\overline{\mathcal{F}}_t$ . . . 311
37.3 Calculating $P(x^n|v^n)$ . . . 312
37.4 Calculating $P(v^n|A, B, \pi)$ . . . 313
37.5 Calculating $\widehat{x}^n$ (Viterbi algorithm) . . . 314
37.6 Calculating $\widehat{A}$, $\widehat{B}$, $\widehat{\pi}$ (Baum-Welch algorithm) . . . 316

38 Identification of do queries via LDEN diagrams **318**

39 Influence Diagrams & Utility Nodes **320**

40 Instrumental Inequality and beyond **322**
40.1 I-inequality . . . 322
40.1.1 I-inequality for binary z,d,y . . . 324
40.2 Bounds on Effect of IV on treatment outcome y . . . 325

41 Instrumental Variables **328**
41.1 δ with unmeasured confounder . . . 328
41.2 δ (with unmeasured confounder) can be inferred via IV . . . 329
41.3 More general bnets with IVs . . . 330
41.4 Instrumental Inequality . . . 331

42 Jackknife Resampling **332**
42.1 Case $A = A^n(\vec{x}) = \frac{1}{n}\sum_\sigma x^\sigma$ 334

43 Junction Tree Algorithm **336**

44 Kalman Filter **337**
44.1 Prediction Problem 338
44.2 Solution 339
44.3 Simple Example 340
44.4 Invariants 341
44.5 Derivation of Solution 341

45 LATE (Local Average Treatment Effect) **343**

46 LDEN with feedback loops **349**

47 Linear and Logistic Regression **356**
47.1 Generalization to x with multiple components (features) 358
47.2 Alternative $V(b, m)$ for logistic regression 358

48 Linear Deterministic Bnets with External Noise **360**
48.1 Example of LDEN diagram 360
48.2 LDEN equations and their 2 solutions 361
48.3 Fully connected LDEN diagrams 362
48.3.1 Fully connected LDEN diagram with $nx = 2$ 362
48.3.2 Fully connected LDEN diagram with $nx = 3$ 364
48.3.3 Fully connected LDEN diagram with arbitrary nx 366
48.4 Not fully connected LDEN diagrams 368
48.5 LDEN diagram with conditioned nodes 369
48.6 SCuMpy 369
48.7 Non-linear DEN diagrams 369

49 Marginalizer Nodes **371**

50 Markov Blankets **373**

51 Markov Chain Monte Carlo (MCMC) **375**
51.1 Inverse Cumulative Sampling 375
51.2 Rejection Sampling 377
51.3 Metropolis-Hastings Sampling 378
51.4 Gibbs Sampling 381
51.5 Importance Sampling 382

52 Markov Chains **384**

53 Mediation Analysis **385**

54 Mendelian Randomization **392**

55 Message Passing and Bethe Free Energy **394**
55.1 2MRFs . . . 394
55.2 Message Passing Intuition . . . 395
55.3 $-\ln Z_\theta$= Free Energy (FE) . . . 399
55.4 $-\ln Z_{\theta^*}$= Minimum FE . . . 400
55.5 $-\ln Z_\theta^{tree}$=Tree FE (a.k.a. Bethe FE) . . . 401
55.6 $-\ln Z_{\theta^*}^{tree}$= Tree Minimum FE, and message passing . . . 402

56 Message Passing, Pearl's theory **406**
56.1 Distributed Soldier Counting . . . 406
56.2 Spring Systems . . . 408
56.3 BP for Markov Chains . . . 408
56.4 BP Algorithm for Polytrees . . . 416
56.4.1 How BP algo for polytrees reduces to the BP algo for Markov chains . . . 419
56.5 Derivation of BP Algorithm for Polytrees . . . 420
56.6 Example of BP algo for a Tree . . . 423
56.7 Bipartite bnets . . . 427
56.8 BP for bipartite bnets (BP-BB) . . . 428
56.8.1 BP-BB and general BP agree on Markov chains . . . 430
56.8.2 BP-BB and general BP agree on tree bnets. . . . 432
56.9 BP-BB and sum-product decomposition . . . 434

57 Message Passing in Quantum Mechanics **435**

58 Meta-learners for estimating ATE **436**

59 Missing Data, Imputation **440**
59.1 Imputation via EM . . . 441
59.2 Imputation via MCMC . . . 444
59.3 Multiple Imputations . . . 445

60 Modified Treatment Policy **446**
60.1 One time MTP . . . 446
60.2 $\Delta_{|c}$ estimand . . . 450
60.3 Estimates of $\Delta_{|c}$ . . . 453
60.3.1 Empirical estimate of $\Delta_{|c}$ . . . 453
60.3.2 OR estimate of $\Delta_{|c}$ . . . 453
60.4 Other Estimands besides $\Delta_{|c}$ . . . 456
60.5 Multi-time MTP . . . 456

61 Monty Hall Problem **459**

62 Multi-armed Bandits **461**
62.1 Bnet for MAB . . . 462
62.2 Reward functions . . . 464
62.3 Regret functions . . . 466
62.4 Strategies with random exploration . . . 467
62.4.1 ϵ-greedy algorithm . . . 467
62.4.2 ϵ_t-greedy algorithm . . . 468
62.5 Strategies with nonrandom exploration . . . 468
62.5.1 Upper Confidence Bounds (UCB) algorithms . . . 468
Frequentist UCB (UCB1) algorithm . . . 469
Bayesian UCB algorithm . . . 469
62.5.2 Thompson Sampling MAB (TS-MAB) algorithm . . . 471
Bnet for general TS-MAB algorithm . . . 471
TS-MAB algorithm with Beta agent and Bernoulli environment 472
TS-MAB algorithm, skeletal reprise . . . 473
62.5.3 Grad-MAB algorithm . . . 474

63 Naive Bayes **477**

64 Neural Networks **478**
64.1 Activation Functions $\mathcal{A}_i^\lambda : \mathbb{R} \to \mathbb{R}$ . . . 479
64.2 Weight optimization via supervised training and gradient descent . . 480
64.3 Non-dense layers . . . 482
64.4 Autoencoder NN . . . 484

65 Noisy-OR gate **485**
65.1 3 ways to interpret the parameters π_i . . . 486

66 Non-negative Matrix Factorization **490**
66.1 Bnet interpretation . . . 490
66.2 Simplest recursive algorithm . . . 491

67 Observationally Equivalent DAGs **492**
67.1 Examples . . . 492

68 Omitted Variable Bias **495**

69 Personalized Expected Utility **501**
69.1 Goal of PEU Theory . . . 502
69.2 Bnets for PEU Theory . . . 503
69.3 Bounds on *EU* for unspecified bnet . . . 503
69.4 Bounds on *EU* for specific bnet families . . . 506

70 Personalized Treatment Effects **507**
70.1 Goal, Strategy and Rationale of PTE theory . . . 508
70.2 Bnets for PTE theory . . . 510
70.3 $ATE = PB - PH$ . . . 511
70.4 Probabilities Relevant to PTE theory . . . 512
70.5 Symmetry . . . 517
70.6 Linear Programming Problem . . . 518
70.7 Special constraints . . . 519
70.8 Matrix representation of probabilities . . . 522
70.9 Bounds on Exp. Probs. imposed by Obs. Probs. . . . 525
70.10 Bounds on $PNS3$ for unspecified bnet . . . 527
70.11 Bounds on $PNS3$ for specific bnet families . . . 533
70.12 Bounds on ATE imposed by Obs. Probs. . . . 533
70.13 Bounds on PNS in terms of ATE and Obs. Probs. . . . 533
70.14 Numerical Examples . . . 534

71 Plate Notation **536**

72 Potential Outcomes and Beyond **538**
72.1 G and G_{den} bnets, the starting point bnets . . . 539
72.2 G bnet with nodes $y^\sigma(0), y^\sigma(1)$ added to it. . . . 541
72.3 Expected Values of treatment outcome y^σ . . . 543
72.4 Translation Dictionary . . . 543
72.5 $\mathcal{Y}_{|d,x} = \mathcal{Y}_{d|d,x}$ (SUTVA) . . . 544
72.6 Conditional Independence Assumption (CIA) . . . 545
72.7 Treatment Effects . . . 545
72.8 Insights into what makes treatment effects equal and $\mathcal{Y}_{1|0} = \mathcal{Y}_1$ . . . 548
72.9 G_{do+} bnet . . . 549
72.10 $ACE = ATE$ . . . 550
72.11 Good, Bad Controls . . . 551
72.12 PO Confounder Sensitivity Analysis . . . 552
72.13 (SDO, ATE) space . . . 554
72.14 Strata-Matching . . . 557
72.14.1 Exact strata-matching . . . 557
Estimates of Treatment Effects . . . 557
Example, estimation of treatment effects . . . 559
72.14.2 Approximate strata-matching . . . 561
72.14.3 Unbiased strata-matching estimates . . . 561
72.15 Propensities . . . 563
72.16 Propensity based estimates of treatment effects . . . 567
72.17 Positivity . . . 568
72.18 Multi-time PO bnets (Panel Data) . . . 569

73 Program evaluation and review technique (PERT) 573
73.1 Example . . . 575

74 Random Forest and Bagging 579
74.1 Bagging (with fully-featured bags) . . . 579
74.2 Bagging (with randomly-shortened bags) . . . 581

75 Recurrent Neural Networks 582
75.1 Language Sequence Modeling . . . 585
75.2 Other types of RNN . . . 585
75.2.1 Long Short Term Memory (LSTM) unit (1997) . . . 587
75.2.2 Gated Recurrence Unit (GRU) (2014) . . . 589

76 Regression Discontinuity Design 591
76.1 PO analysis . . . 591
76.2 Linear Regression . . . 593

77 Regularization of Loss Functions 594
77.1 L^p norm ROLF . . . 595
77.1.1 L^1 norm ROLF can lead to sparsity . . . 595
77.1.2 L^2 norm ROLF for Least Squares . . . 597
77.2 Proximal functions . . . 598
77.3 Proximal ROLF . . . 600
77.4 Unobserved Nodes of a bnet . . . 601

78 Reinforcement Learning (RL) 603
78.1 Exact RL bnet . . . 606
78.2 Actor-Critic RL bnet . . . 608
78.3 Q function learning RL bnet . . . 610

79 Reliability Box Diagrams and Fault Tree Diagrams 612
79.1 Minimal Cut Sets . . . 618

80 Restricted Boltzmann Machines 620

81 ROC curves 622
81.1 Terminology Table Adapted from Wikipedia Ref.[150] . . . 625

82 Scoring the Nodes of a Learned Bnet 627
82.1 Probability Distributions and Special Functions . . . 628
82.2 Single node with no parents . . . 629
82.3 Multiple nodes with any number of parents . . . 632
82.4 Bayesian Scores . . . 633
82.5 Information Theoretic scores . . . 634

83 Selection Bias Removal **635**
83.1 Pre and Post Switch Nodes . . . 636
83.2 Removing SB from passive query $P(y|x)$ . . . 638
83.3 Removing SB from active query $P(y|\mathcal{D}x)$ . . . 640

84 Sentence Splitting with SentenceAx **642**
84.1 Preliminary Conventions . . . 642
84.1.1 Tensor Notation . . . 642
84.1.2 PyTorch conventions . . . 643
84.2 Bayesian Network for this model . . . 648
84.3 Loss $\mathcal{L}$ for this model . . . 650

85 Shannon Information Theory **653**

86 Shapley Explainability **654**
86.0.1 Numerical examples of SHAP . . . 657

87 Simpson's Paradox **660**
87.1 Pearl Causality . . . 662
87.2 Numerical Example . . . 664

88 Structure and Parameter Learning for Bnets **665**
88.1 Overview . . . 665
88.2 Score based SL algorithms . . . 667
88.3 Constraint based SL algorithms . . . 668
88.4 Pseudo-code for some bnet learning algorithms . . . 669

89 Support Vector Machines And Kernel Method **671**
89.1 Learning Algorithm for SVM Classifier . . . 672
89.2 Linear (dot-product) Kernel . . . 673
89.3 Alternatives to Linear Kernel . . . 677
89.4 Random Forest and Kernel Method . . . 677

90 Survival Analysis **678**
90.1 $S(t)$ estimates . . . 680
90.1.1 No-censoring estimate of $S(t)$ . . . 680
90.1.2 Kaplan-Meier estimate of $S(t)$ . . . 680
90.2 $\lambda(t)$ models . . . 685
90.2.1 $\lambda(t)$ independent of covariates Z . . . 685
90.2.2 $\lambda(t)$ dependent on covariates Z . . . 686
90.3 $S_0(t)$ estimates . . . 689

91 Synthetic Controls **691**
91.1 PO analysis . . . 693

92 Targeted Estimator **695**
92.1 Goal, Strategy, and Rationale of TE theory . . . 695
92.2 Functional Calculus . . . 697
92.3 Linear Approximation of $\Psi[P_N]$ . . . 699
92.4 ATE estimand . . . 700
92.5 ATE estimates . . . 701
92.5.1 Ψ^E . . . 701
92.5.2 Ψ^G . . . 702
92.5.3 Ψ^{IPW} . . . 702
92.5.4 Ψ^{LIPW} . . . 702
92.5.5 Ψ^{LIPW++} (a.k.a. Ψ^{TMLE}) . . . 706
92.6 Ψ^{TMLE} in practice . . . 709

93 Time Series Analysis: ARMA and VAR **711**
93.1 White noise . . . 711
93.2 Backshift operator . . . 712
93.3 Metrics . . . 712
93.4 Definition of $ARMA(p,q)$, $AR(p)$ and $MA(q)$. . . . 714
93.5 Solving $AR(p)$ . . . 716
93.6 Solving $MA(q)$ . . . 717
93.7 Solving $ARMA(p,q)$ . . . 718
93.8 Auto-correlation and partial auto-correlation . . . 718
93.9 Generating function of auto-correlation . . . 722
93.10Impulse Response . . . 723
93.11$AR(p)$ and Yule-Walker equations . . . 724

Chapter 95

Transformer Networks

The primary reference for this chapter is Ref.[81]. Ref.[81] is the highly influential 2017 paper entitled "Attention is all you need" that introduced **Transformer Networks** (tranets) and Attention into the AI vernacular. Besides Ref.[81], I also read blog posts such as Ref.[29] and the Wikipedia article on tranet (Ref. [162]). For a complete list of the large number of excellent blog post that I read to learn about this subject, see my open source software texnn (Ref.[80]).[1]

Transformer Networks (tranets) have been taking the fields of Natural Language Processing (NLP) and Large Language Models (LLM) by storm in recent years. They were introduced in 2017 and already are the basis of numerous LLMs. Two famous examples are, BERT (Bidirectional Encoder Representations from Transformers) and ChatGPT (Generative Pre-trained Transformer). Both of these have been trained with huge databases, of which all of the English Wikipedia ($\sim 10^9$ words) is but a small part.

How well ChatGPT works was a huge surprise to most people, including experts in AI/ML. My conjecture is that this surprising LLM performance is due to causality. Let me explain. I believe tranets and the LLM that use them, are just curve-fitters (so are Least Squares, vanilla NNs, Convolutional NNs, etc.). But, we lucked out, because tranets are very good at fitting causal data, and the space of all human generated text, including math equations and computer code, is causally connected (i.e., has a **causally connected topology**.).

Normally, tranets are drawn as box diagrams that are somewhat cryptic and ambiguous, at least to me. In this chapter, instead of drawing them as box diagrams, I represent them as causal DAGs (bnets). This makes their causal nature more explicit than the box diagrams, and, in my opinion, also makes them less ambiguous and more understandable than the box diagrams.

Recurrent Neural Nets (RNNs) are discussed in Chapter 75. tranets are quickly displacing RNNs, an older method, in NLP. tranets are better than RNNs for doing

[1] texnn is Python software that I wrote specifically for drawing the bnets of this chapter, but later I generalized it to a stand-alone app that can draw any bnet (including SCMs, NNs and tranets), not just a tranet bnet.

NLP in several important ways. Whereas RNNs analyze the tokens (words) of a sentence sequentially (like a Kalman Filter), tranets analyze them in parallel, and thus are more amenable to parallel computing. Also, because RNNs analyze the words of a sentence sequentially, they tend to give more importance to the end of a sentence than to its beginning. That's because RNNs start forgetting the beginning of a sentence by the time they reach its end, like a patient with Alzheimer's. tranets do not suffer from this malady.

Dynamical bnets are discussed in Chapter 25. In Chapter 75, we showed that RNNs are dynamical bnets. In this chapter we will show that tranets are dynamical bnets too.

In this chapter, we will use the Numpy-like tensor notation discussed in Section C.48. In particular, note that $[n] = [0:n] = \{0, 1, \ldots, n-1\}$ and that $T^{[n],[m]}$ is an $n \times m$ matrix.

95.1 Tensor Notation

Our tensor notation is discussed in Section C.48. Here is a quick review of some of the more salient facts in that section on tensors. Below, we will often accompany an equation in tensor component notation with the equivalent matrix equation, in parenthesis.

We use Greek letters for tensor indices.

Let $\alpha \in [a]$, $\beta \in [b]$, $\gamma \in [c]$, $\delta \in [d]$, $\nu \in [n]$, $\Delta \in [D]$.

- **reshaping**

$$T^{\nu,\delta} \to T^{\Delta} \quad \left(T^{[n_{\underline{h}}],[d]} \to T^{[D]}\right) \tag{95.1}$$

$$T^{\Delta} \to T^{\nu,\delta} \quad \left(T^{[D]} \to T^{[n_{\underline{h}}],[d]}\right) \tag{95.2}$$

- **concatenation**

$$T^{[n]} = (T^0, T^1, \ldots, T^{n-1}) = (T^{\nu})_{\nu \in [n]} \tag{95.3}$$

- **Hadamard product (element-wise, entry-wise multiplication)**

$$T^{[n]} * S^{[n]} = (T^{\nu} S^{\nu})_{\nu \in [n]} \tag{95.4}$$

- **Matrix multiplication**

  $T^{[n]} = T^{[n],[1]}$ is a column vector.

$$(T^{[n]})^T S^{[n]} = \text{scalar} \tag{95.5}$$

$$T^{[a],[b]}S^{[b],[c]} = \left[\sum_{\beta\in[b]} T^{\alpha,\beta}S^{\beta,\gamma}\right]_{\alpha\in[a],\gamma\in[c]} \tag{95.6}$$

Most treatments of tranets, including the "Attention is all you need" paper, order the operations chronologically from left to right (L2R). So if A occurs before B, they write AB. This is contrary to what is done in Linear Algebra, where one orders the operations chronologically from right to left (R2L), and one writes BA. In this chapter, will adhere to the Linear Algebra convention, since it is so prevalent and is the overwhelming precedent.

95.2 Recurrent Neural Net with Attention

95.2.1 Single Head Attention

Let

ℓ be the maximum number of words allowed in a sentence. Some words might be blanks (padding).

d be the so called **hidden or embedding dimension**.

$e^t_\alpha \in \mathbb{R}^d$ be a d-dimensional column vector for word $\alpha \in [\ell]$ at time t.

$W^t_{\underline{q}}, W^t_{\underline{k}}, W^t_{\underline{v}} \in \mathbb{R}^{d\times d}$ be the weight matrices for time slice t. The letters Q, K, V stand for Query, Key and Value, respectively. These matrices are learned by training the net. They transform e^t_α as follows

$$v^t_\alpha = W^t_{\underline{v}} e^t_\alpha \tag{95.7}$$

$$q^t_\alpha = W^t_{\underline{q}} e^t_\alpha \tag{95.8}$$

$$k^t_\alpha = W^t_{\underline{k}} e^t_\alpha \tag{95.9}$$

Fig.95.1 represents a tranet of a 3-word sentence as a dynamical bnet. The TPMs (Transition Probability Matrices), printed in blue, for bnet Fig.95.1, are as follows:

$$P(v^t_\alpha|e^t_\alpha) = \mathbb{1}(\quad v^t_\alpha = W^t_{\underline{v}} e^t_\alpha \quad) \tag{95.10}$$

$$P(q^t_\alpha|e^t_\alpha) = \mathbb{1}(\quad q^t_\alpha = W^t_{\underline{q}} e^t_\alpha \quad) \tag{95.11}$$

$$P(k^t_\alpha|e^t_\alpha) = \mathbb{1}(\quad k^t_\alpha = W^t_{\underline{k}} e^t_\alpha \quad) \tag{95.12}$$

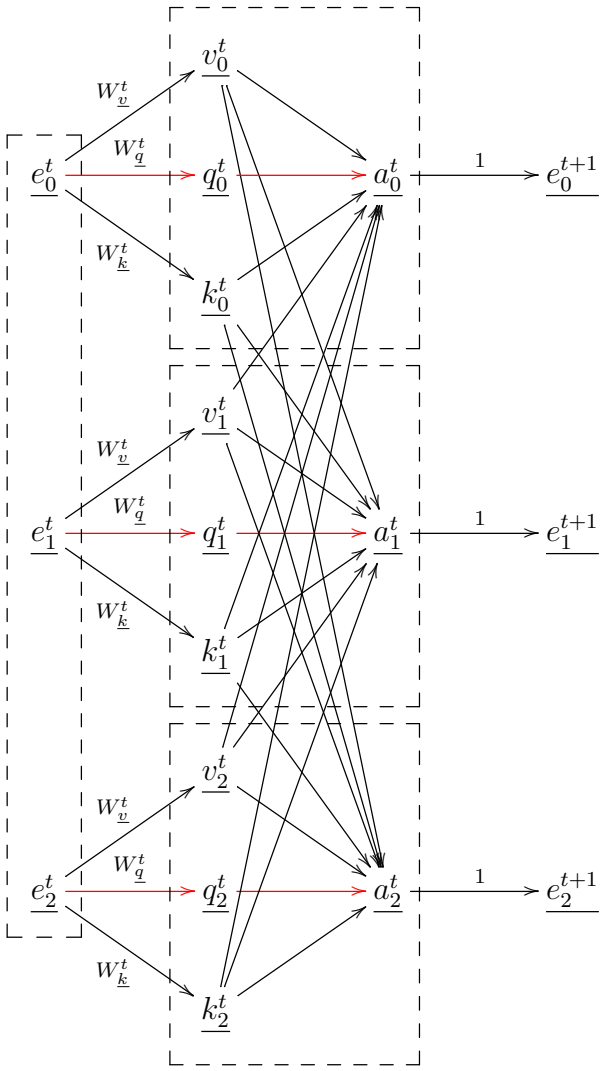

Figure 95.1: Dynamical bnet with single-head Attention for 3 words. Time-slice t. Note that k_α^t for all α points to $\underline{a}_{\alpha'}^t$ for all α'. Likewise, $\underline{v}_\alpha^t$ for all α points to $\underline{a}_{\alpha'}^t$ for all α'. However, $\underline{q}_\alpha^t$ points only to $\underline{a}_\alpha^t$.

$$P(e_\alpha^{t+1}|a_\alpha^t) = \mathbb{1}(\quad e_\alpha^{t+1} = a_\alpha^t \quad) \tag{95.13}$$

$$P(a_\alpha^{t+1}|v_\cdot^t, q_\alpha^t, k_\cdot^t) = \mathbb{1}(\quad a_\alpha^{t+1} = \sum_{\alpha' \in [\ell]} v_{\alpha'}^t P(\alpha'|\alpha) \quad) \tag{95.14}$$

where the conditional probability $P(\alpha'|\alpha)$ is called defined as[2]

[2]The reason sums over $\delta \in [d]$ are divided by $\sqrt{d}$ is to prevent the argument of the exponential

$$P(\alpha'|\alpha) = \text{softmax}\left[\frac{1}{\sqrt{d}}\sum_{\delta\in[d]}(k^t)^{\delta,[\ell]}(q^t)^{\delta,\alpha}\right](\alpha'|\alpha) \tag{95.15}$$

$$= \frac{\exp\left(\frac{1}{\sqrt{d}}(k^t_{\alpha'})^T q^t_\alpha\right)}{\sum_{\alpha''\in[\ell]}\exp\left(\frac{1}{\sqrt{d}}(k^t_{\alpha''})^T q^t_\alpha\right)} \tag{95.16}$$

The right hand side of Eq.(95.14) constitutes an average over all the word vectors $\{\underline{v}^t_\alpha : \alpha \in [\ell]\}$ in a sentence. This average is called the **Attention** (for a single head).[3]

$$\boxed{\text{Attention}^{\delta,\alpha}\left((v^t)^{[d],[\ell]},(k^t)^{[d],[\ell]},(q^t)^{[d],[\ell]}\right) = \sum_{\alpha'\in[\ell]}(v^t)^{\delta,\alpha'}P(\alpha'|\alpha)} \tag{95.17}$$

On first encounter, the structure of an Attention bnet seems a bit mysterious. Then one realizes that this is an old friend. If the dashed boxes in Fig.95.1 are each "shrunk" to single nodes, then it becomes a TAN Bayes Net. Each of the 3 subgraphs $\underline{e}^t, (\underline{v}^t, \underline{q}^t, \underline{k}^t), \underline{a}^t$ also constitutes a TAN Bayes net. [4].[5] In broad terms, Fig.95.1 can be described by saying that each word undergoes a special kind of 3-class (q,k,v) Naive Bayes classification, and the results of that classification are sent to the new version of every word (except the q class which only sends info to one word, not all of them).

It's also useful to think of Attention as a filter with input signal $(e^t)^{[d],[\ell]}$ and output signal $(e^{t+1})^{[d],[\ell]}$.

Fig.95.1 can be "folded" (i.e., the 3 words can be represented by as single node). When folded, Fig.95.1 becomes Fig.95.2. Note that in Fig.95.2, we have started indicating the shapes of tensors by a superscript, using the tensor notation explained in Section C.48. We will continue doing this henceforth in this chapter.

The structural equations for Fig.95.2, printed in blue, are as follows.

$$(a^t)^{[d],[\ell]} = \text{Attention}((v^t)^{[d],[\ell]},(k^t)^{[d],[\ell]},(q^t)^{[d],[\ell]}) \tag{95.18a}$$

---

from getting too large.

[3] Variations of this definition of Attention have been proposed. This particular one is the original one from the "Attention is all you need paper". Some people call it the "scaled dot product Attention".

[4] Tree Augmented Naive (TAN) Bayes nets were introduced in Chapter 9.

[5] A **reverse or upside down tree** is obtained by reversing the directions of all the arrows of a tree directed graph. A TAN Bayes net is normally defined as in Chapter9, as a Naive Bayes net augmented with a tree. In an Attention bnet, the Naive Bayes Net is augmented with a reverse tree (RT) instead of a tree (T), so technically Attention bnets contain RTAN Bayes nets, not TAN Bayes nets.

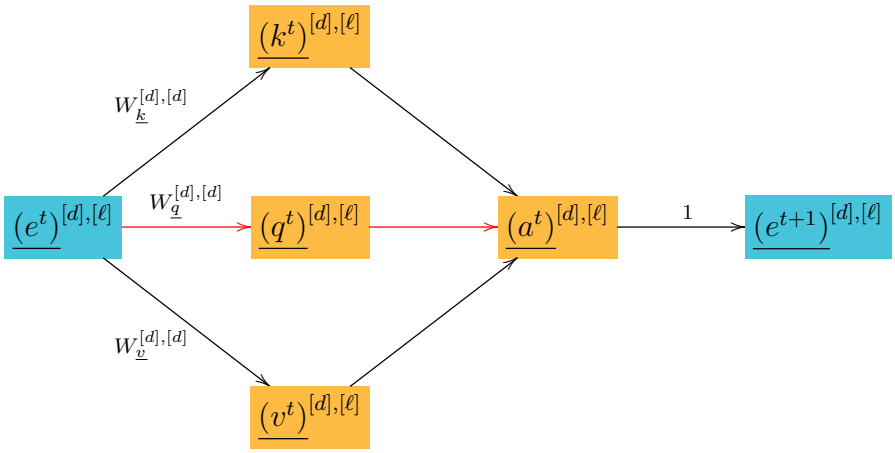

Figure 95.2: Folded version of Fig.95.1 when $\ell = 3$. Note that all orange nodes have the same tensor shape.

$$(e^t)^{[d],[\ell]} = \text{ prior} \tag{95.18b}$$

$$(e^{t+1})^{[d],[\ell]} = (a^t)^{[d],[\ell]} \tag{95.18c}$$

$$(k^t)^{[d],[\ell]} = W_{\underline{k}}^{[d],[d]}(e^t)^{[d],[\ell]} \tag{95.18d}$$

$$(q^t)^{[d],[\ell]} = W_{\underline{q}}^{[d],[d]}(e^t)^{[d],[\ell]} \tag{95.18e}$$

$$(v^t)^{[d],[\ell]} = W_{\underline{v}}^{[d],[d]}(e^t)^{[d],[\ell]} \tag{95.18f}$$

95.2.2 Multi-Head Attention

In this section, we will generalize the single head Attention, as defined in the previous section, to multi-head Attention.

Let

$n_{\underline{h}}$ = number of heads. $\nu \in [n_{\underline{h}}]$.

d = same as before, the hidden, embedding dimension. $\delta \in [d]$

$D = n_{\underline{h}} d$. $\Delta \in [D]$. We will do some tensor reshaping: $T^{[n_{\underline{h}}],[d]} \rightarrow T^{[D]}$, or, in component form, $T^{\nu,\delta} \rightarrow T^{\Delta}$.

Consider weight matrices $W_{\underline{k}}^{[D],[d]}, W_{\underline{q}}^{[D],[d]}$, and $W_{\underline{v}}^{[D],[d]}$ such that

$$(k^t)^{\nu,\delta,\alpha} = \sum_{\delta' \in [d]} W_{\underline{k}}^{\nu,\delta,\delta'} (e^t)^{\delta',\alpha} \tag{95.19}$$

$$(q^t)^{\nu,\delta,\alpha} = \sum_{\delta' \in [d]} W_{\underline{q}}^{\nu,\delta,\delta'} (e^t)^{\delta',\alpha} \tag{95.20}$$

$$(v^t)^{\nu,\delta,\alpha} = \sum_{\delta' \in [d]} W_{\underline{v}}^{\nu,\delta,\delta'} (e^t)^{\delta',\alpha} \tag{95.21}$$

We define the **Multi-head Attention** by

$$\boxed{\text{Attention}^{\nu,\delta,\alpha}\left((v^t)^{[D],[\ell]}, (k^t)^{[D],[\ell]}, (q^t)^{[D],[\ell]}\right) = \sum_{\alpha' \in [\ell]} (v^t)^{\nu,\delta,\alpha'} P(\alpha'|\alpha,\nu)} \tag{95.22}$$

where

$$P(\alpha'|\alpha,\nu) = \text{softmax}\left[\frac{1}{\sqrt{d}} \sum_{\delta \in [d]} (k^t)^{\nu,\delta,[\ell]} (q^t)^{\nu,\delta,\alpha}\right](\alpha'|\alpha,\nu) \tag{95.23}$$

$$= \frac{\exp\left[\frac{1}{\sqrt{d}} \sum_{\delta \in [d]} (k^t)^{\nu,\delta,\alpha'} (q^t)^{\nu,\delta,\alpha}\right]}{\sum_{\alpha'' \in [\ell]} \exp\left[\frac{1}{\sqrt{d}} \sum_{\delta \in [d]} (k^t)^{\nu,\delta,\alpha''} (q^t)^{\nu,\delta,\alpha}\right]} \tag{95.24}$$

The structural equations, printed in blue, for the bnet Fig.95.3, are as follows. Note that Attention() always has the same tensor shape as its 3 arguments. Note also that the 3 weight matrices $W_{\underline{k}}^{[D],[d]}$, $W_{\underline{q}}^{[D],[d]}$, and $W_{\underline{v}}^{[D],[d]}$ raise the hidden dimension, whereas the weight matrix $W_{\underline{a}}^{[d],[D]}$ lowers it. $W_{\underline{a}}^{[d],[D]} = 1$ in the single head case.

$$(a^t)^{[D],[\ell]} = \text{Attention}((v^t)^{[D],[\ell]}, (k^t)^{[D],[\ell]}, (q^t)^{[D],[\ell]}) \tag{95.25a}$$

$$(e^t)^{[d],[\ell]} = \text{prior} \tag{95.25b}$$

$$(e^{t+1})^{[d],[\ell]} = W_{\underline{a}}^{[d],[D]} (a^t)^{[D],[\ell]} \tag{95.25c}$$

$$(k^t)^{[D],[\ell]} = W_{\underline{k}}^{[D],[d]} (e^t)^{[d],[\ell]} \tag{95.25d}$$

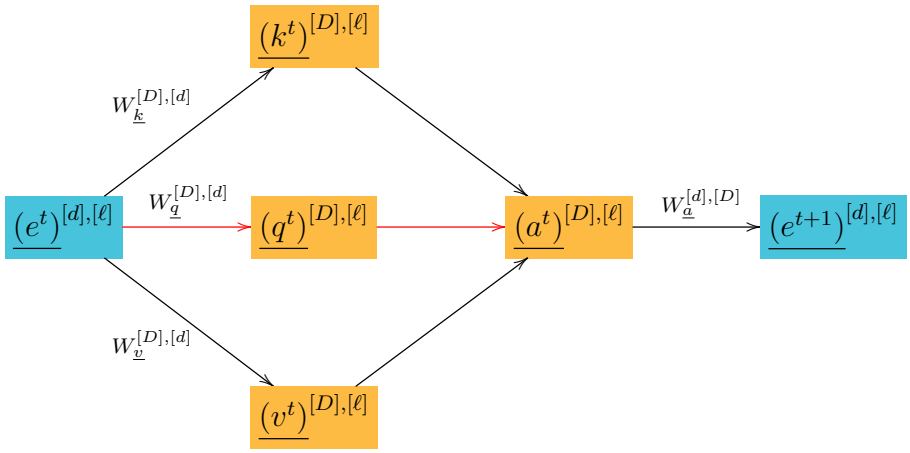

Figure 95.3: Dynamical bnet with single-head Attention for ℓ words. Time-slice t. This is a generalization of the single head Attention of Fig.95.2. Note that all orange nodes have the same tensor shape.

$$(q^t)^{[D],[\ell]} = W_{\underline{q}}^{[D],[d]}(e^t)^{[d],[\ell]} \tag{95.25e}$$

$$(v^t)^{[D],[\ell]} = W_{\underline{v}}^{[D],[d]}(e^t)^{[d],[\ell]} \tag{95.25f}$$

95.3 Vanilla tranet

In this section, we will discuss the tranet of the "Attention is all you need" paper, Ref.[81]. As is common in the literature, we will refer to that tranet as the "Vanilla" tranet. Ref.[81] describes its tranet graphically with Fig.95.4. Our goal is to find a causal DAG (bnet) version of that figure.

Let

$\ell =$, context window, maximum number of words in a sentence segment. $\alpha \in [\ell]$, $\ell \sim 100$

$L =$ number of words in vocabulary, $\beta \in [L]$, $L >> \ell$

$d = d_{\underline{q}} = d_{\underline{k}} = d_{\underline{v}} = 64$, hidden dimension per head, $\delta \in [d]$.

$n_{\underline{h}} = 8$, number of heads, $\nu \in [n_{\underline{h}}]$

$D = n_{\underline{h}} d = 8(64) = 512$, hidden dimension for all heads, $\Delta \in [D]$

$\Lambda = 6$, number copies, connected in series, of boxed bnet, $\lambda \in [\Lambda]$

Before we present the bnet version of Fig.95.4, we discuss some of the definitions needed to understand and motivate Fig.95.4.

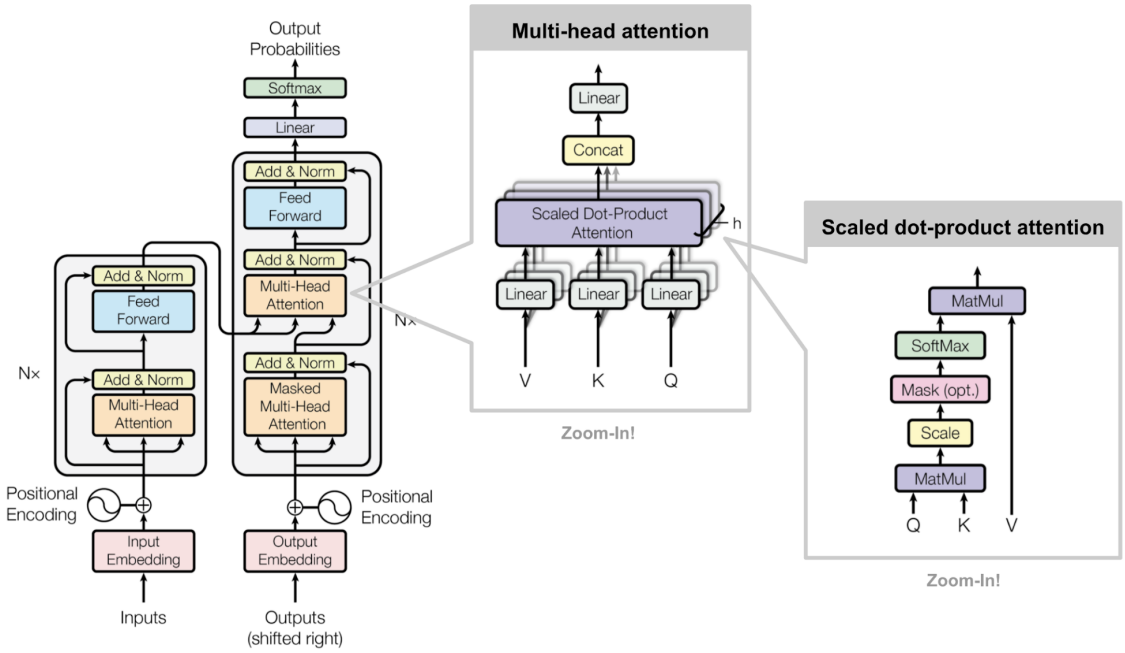

Figure 95.4: Vanilla tranet

- **Encoder Input** $x^{\beta,\alpha}$

$$x^{\beta,\alpha} = \delta(\beta, \beta(\alpha)) \left(x^{[L],[\ell]} \text{ has one hot columns.}\right) \tag{95.26}$$

- **Embedding (a.k.a. encoding) Matrix** $\mathcal{E}^{\delta,\beta}$

$$e^{\delta,\alpha} = \sum_{\beta} \mathcal{E}^{\delta,\beta} x^{\beta,\alpha} \quad \left(e^{[d],[\ell]} = \mathcal{E}^{[d],[L]} x^{[L],[\ell]}\right) \tag{95.27}$$

- **Weight matrices** $W_{\underline{q}}, W_{\underline{k}}, W_{\underline{v}}$

$$Q^{\nu,\delta,\alpha} = \sum_{\delta'} W_{\underline{q}}^{\nu,\delta,\delta'} e^{\delta',\alpha} \quad \left(Q^{[D],[\ell]} = W_{\underline{q}}^{[D],[d]} e^{[d],[\ell]}\right) \tag{95.28}$$

$$K^{\nu,\delta,\alpha} = \sum_{\delta'} W_{\underline{k}}^{\nu,\delta,\delta'} e^{\delta',\alpha} \quad \left(K^{[D],[\ell]} = W_{\underline{k}}^{[D],[d]} e^{[d],[\ell]}\right) \tag{95.29}$$

$$V^{\nu,\delta,\alpha} = \sum_{\delta'} W_{\underline{v}}^{\nu,\delta,\delta'} e^{\delta',\alpha} \quad \left(V^{[D],[\ell]} = W_{\underline{v}}^{[D],[d]} e^{[d],[\ell]}\right) \tag{95.30}$$

- **Multi-head Attention**

$$B^{\nu,\alpha',\alpha} = \frac{1}{\sqrt{d}} \sum_{\delta} K^{\nu,\delta,\alpha'} Q^{\nu,\delta,\alpha} \quad \left(B^{[n_h],[\ell],[\ell]} = \left[\frac{1}{\sqrt{d}} (K^{\nu,[d],[\ell]})^T Q^{\nu,[d],[\ell]} \right]_{\nu \in [n_{\underline{h}}]} \right) \tag{95.31}$$

$$A^{\nu,\delta,\alpha} = \sum_{\alpha'} V^{\nu,\delta,\alpha'} \underbrace{\text{softmax}(B^{\nu,[\ell],\alpha})(\alpha'|\alpha,\nu)}_{P(\alpha'|\alpha,\nu)} \tag{95.32}$$

$$\sum_{\alpha' \in [\ell]} P(\alpha'|\alpha,\nu) = 1 \tag{95.33}$$

$$A^{\nu,\delta,\alpha} \to A^{\Delta,\alpha} \left(A^{[n_{\underline{h}}],[d],[\ell]} \to A^{[D],[\ell]} \right) \tag{95.34}$$

Column vector notation:

$$B^{\nu,\alpha',\alpha} = \frac{1}{\sqrt{d}} (K^{\nu,[d],\alpha'})^T Q^{\nu,[d],\alpha} \tag{95.35}$$

Important: Note that the softmax() makes the α' component a probability, not the α one!

For example, suppose $\nu = 1$ (one head), $\ell = 2$ (a 2 word segment), and $d = 3$ (hidden dimension is 3). The $Q^{[3],[2]}, K^{[3],[2]}, V^{[3],[2]}$ are 3×2 matrices (i.e., two 3-dim column vectors). One uses the $Q^{[3],[2]}$ and $K^{[3],[2]}$ to arrive at a 2×2 matrix $P(\alpha'|\alpha)$ of probabilities. Then one uses that matrix of probabilities to replace

$$\left[V^{[3],0}, V^{[3],1} \right] \to \left[V^{[3],0} P(0|0) + V^{[3],1} P(1|0), V^{[3],0} P(0|1) + V^{[3],1} P(1|1) \right] \tag{95.36}$$

- **Positional Embedding Matrix $\mathcal{E}^{\delta,\beta}_{pos}$**

$$\mathcal{E}^{\delta,\beta}_{pos} = \begin{cases} \sin\left(2\pi \frac{\beta}{(2\pi)10^{4\delta/d}}\right) = \sin(2\pi \frac{\beta}{\lambda(\delta)}) & \text{if } \delta \text{ is even} \\ \cos\left(2\pi \frac{\beta}{(2\pi)10^{4(\delta-1)/d}}\right) = \cos(2\pi \frac{\beta}{\lambda(\delta)}) & \text{if } \delta \text{ is odd} \end{cases} \tag{95.37}$$

$\mathcal{E}^{\delta,\beta}_{pos}$ changes in phase by $\pi/2$ every time δ changes by 1. Its wavelength λ is independent of β, but increases rapidly with δ, from $\lambda(\delta = 0) = 2\pi * 1$ to $\lambda(\delta = d) = 2\pi * 10^4$.

Total Embedding equals initial embedding plus positional embedding:

$$\mathcal{E}^{\delta,\beta} = \mathcal{E}_0^{\delta,\beta} + \mathcal{E}_{pos}^{\delta,\beta} \tag{95.38}$$

The purpose of positional embedding is to take $e^{\beta,\alpha}$ to $e^{\delta,\alpha} = \sum_\beta \mathcal{E}_{pos}^{\delta,\beta} e^{\beta,\alpha}$ where $e^{\delta,\alpha}$ changes quickly as δ (i.e., position) changes.

- **ReLU**

  For a tensor T of arbitrary shape,

$$ReLU(T) = (T)_+ = max(0, T) \tag{95.39}$$

  max element-wise.

- **Feed Forward Neural Net**

$$F(e^{\delta,\alpha}) = \sum_{\Delta \in [n_{ff}]} W_2^{\delta,\Delta} ReLU \left(\sum_{\delta' \in [d]} W_1^{\Delta,\delta'} e^{\delta',\alpha} + b_1^{\Delta,\alpha} \right) + b_2^{\delta,\alpha} \tag{95.40}$$

  n_{ff} is called the `intermediate_size` in BERT.

- **Softmax**

  softmax() takes a vector and returns a vector of probabilities of the same length

$$e^{[n]} \to P^{[n]} \tag{95.41}$$

  where

$$P^\alpha = \frac{\exp(e^\alpha)}{\sum_{\alpha \in [n]} \exp(e^\alpha)} \quad \left(P^{[n]} = \frac{\exp(e^{[n]})}{\| \exp(e^{[n]}) \|_0} \right) \tag{95.42}$$

  For example,

$$(1, 0, 0) \to (e, 1, 1)/norm \tag{95.43}$$

$$(10, 0, 0) \to (e^{10}, 1, 1)/norm \approx (1, 0, 0) \tag{95.44}$$

  For any $a \in \mathbb{R}$,

$$(a, a, a) \to \frac{1}{3}(1, 1, 1) \tag{95.45}$$

- **Skip Connection (Add & Normalize)**

  A **skip connection** is when you split the input to a **filter** into two streams, one stream goes through the filter, the other doesn't. The one that doesn't is then merged with the output of the filter via a **add & normalize** node. The reason

for making skip connections is that the signal exiting a filter is usually full of jumps and kinks. By merging that filter output with some of the filter input, one smooths out the filter output to some degree. This makes back-propagation differentiation better behaved.

The filter might be a Multi-Head Attention or a Feed Forward NN.

Add & Normalize just means $(A+B)/norm$ where A and B are the two input signals and "norm" is some norm of $A+B$ (for instance, $\| A+B \|_2$).

Normalization keeps the signal from growing too big and saturating the signal that will enter components upstream. Normalization can also involve subtracting the mean $\langle X \rangle$ of the signal X so as to get a signal $X - \langle X \rangle$ that has zero mean.

- **Redundancy**

  For better results, the Encoder and Decoder both contain Λ copies, connected in series, of the boxed bnet.

  Redundancy (see Chapter 79) has been used to avoid catastrophic failure at least as early as the dawn of the age of rocketry, when it was used to avoid the all too common occurrence of exploding rockets. There are 2 basic types of redundancy: in series connection (as in the layers in a feedforward NN), and in parallel connection (as in tranet heads, and the plates in a bnet (see Chapter 71)).

- **Right Shifted Outputs**

  "Outputs (Shifted Right)" in Fig.95.4 refers to what is called **forced teaching** in the RNN (recurrent neural net) literature. We explain forced teaching in Fig.95.5.

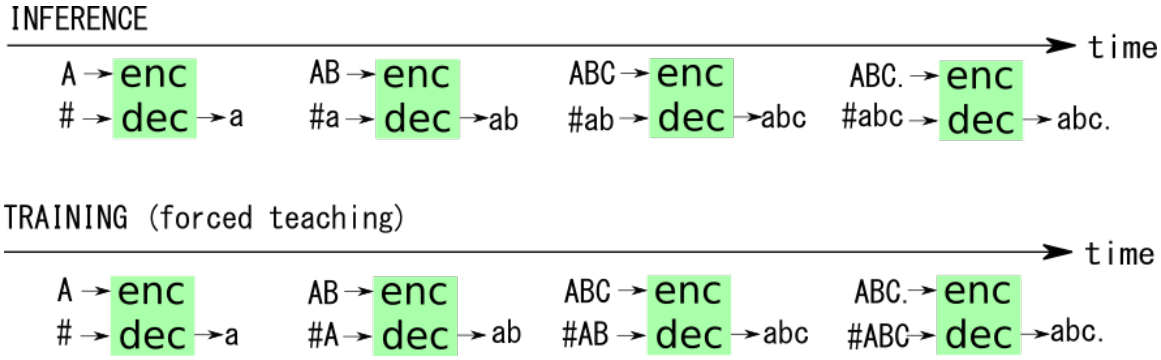

Figure 95.5: Training and Inference for vanilla transformer. "enc" and "dec" denote the encoder and decoder, respectively. A hash character represents the SOS (start of sentence) token, and a period represents the EOS (end of sentence) token. Capital letters represent ground truth tokens, and lower case ones represent predictions.

- **Masked Attention**

$$P(\alpha'|\alpha,\nu) = 0 \quad \text{if } \alpha' < \alpha \tag{95.46}$$

α, and α' are sentence positions and α' is in the future (downstream) compared to α. So as to not violate causality, this condition enforces the constraint that no attention is paid to sentence positions in the future of α.

95.3.1 Single Head Attention

Fig.95.6 gives a bnet representation of the "Single Head Attention" portion of Fig.95.4. The structural equations for that bnet, printed in blue, are as follows.

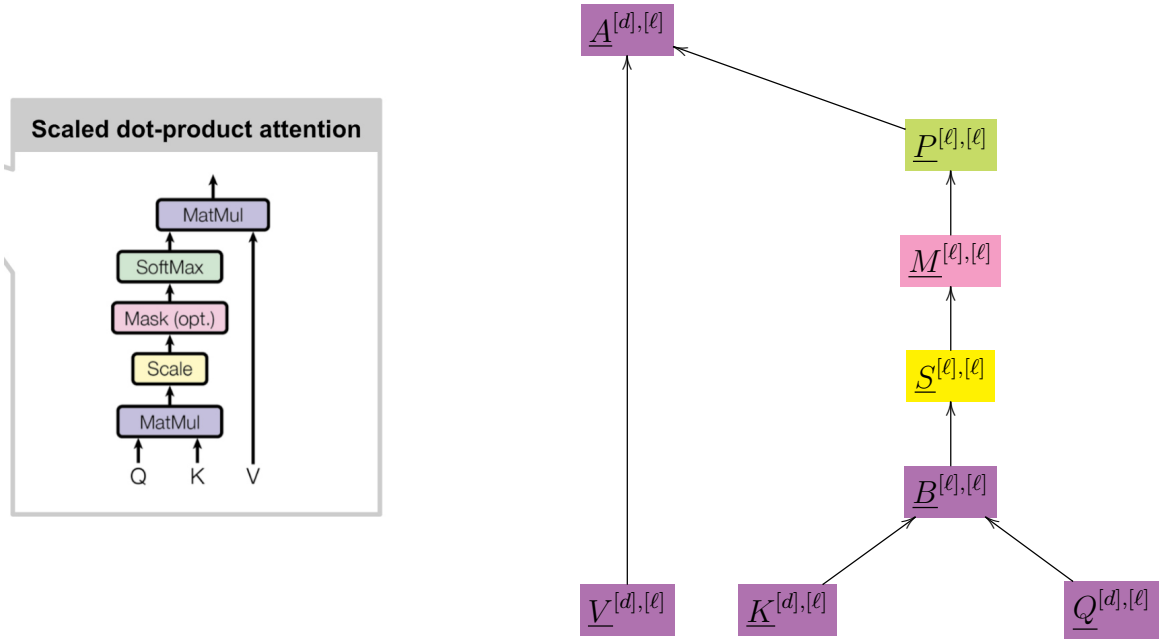

Figure 95.6: Single Head Attention. (Scaled Dot Product)

$$A^{[d],[\ell]} = V^{[d],[\ell]} P^{[\ell],[\ell]} \quad \left(\text{Note that } \sum_{\alpha \in [\ell]} P^{\alpha,[\ell]} = 1 \right) \tag{95.47a}$$

$$B^{[\ell],[\ell]} = (K^{[d],[\ell]})^T Q^{[d],[\ell]} \tag{95.47b}$$

$$K^{[d],[\ell]} = \text{ prior} \tag{95.47c}$$

$$M^{[\ell],[\ell]} = \text{mask}(S^{[\ell],[\ell]}) \tag{95.47d}$$

$$P^{[\ell],[\ell]} = \text{softmax}(M^{[\ell],[\ell]}) \quad \left(\text{Note that } \sum_{\alpha \in [\ell]} P^{\alpha,[\ell]} = 1 \right) \tag{95.47e}$$

$$Q^{[d],[\ell]} = \text{ prior} \tag{95.47f}$$

$$S^{[\ell],[\ell]} = \frac{B^{[\ell],[\ell]}}{\sqrt{d}} \tag{95.47g}$$

$$V^{[d],[\ell]} = \text{ prior} \tag{95.47h}$$

95.3.2 Multi-Head Attention

Fig.95.7 gives a bnet representation of the "Multi-Head Attention" portion of Fig.95.4. The structural equations for that bnet, printed in blue, are as follows.

$$A^{[D],[\ell]} = [A_0^{[d],[\ell]} | A_1^{[d],[\ell]}] \tag{95.48a}$$

$$A_0^{[d],[\ell]} = \text{Attention}(V_0^{[d],[\ell]}, K_0^{[d],[\ell]}, Q_0^{[d],[\ell]}) \tag{95.48b}$$

$$A_1^{[d],[\ell]} = \text{Attention}(V_1^{[d],[\ell]}, K_1^{[d],[\ell]}, Q_1^{[d],[\ell]}) \tag{95.48c}$$

$$K^{[D],[\ell]} = W_{\underline{k}}^{[D],[d]} e^{[d],[\ell]} \tag{95.48d}$$

$$K_0^{[d],[\ell]} = \text{linear}(K^{[D],[\ell]}) \text{ (split, then project a component)} \tag{95.48e}$$

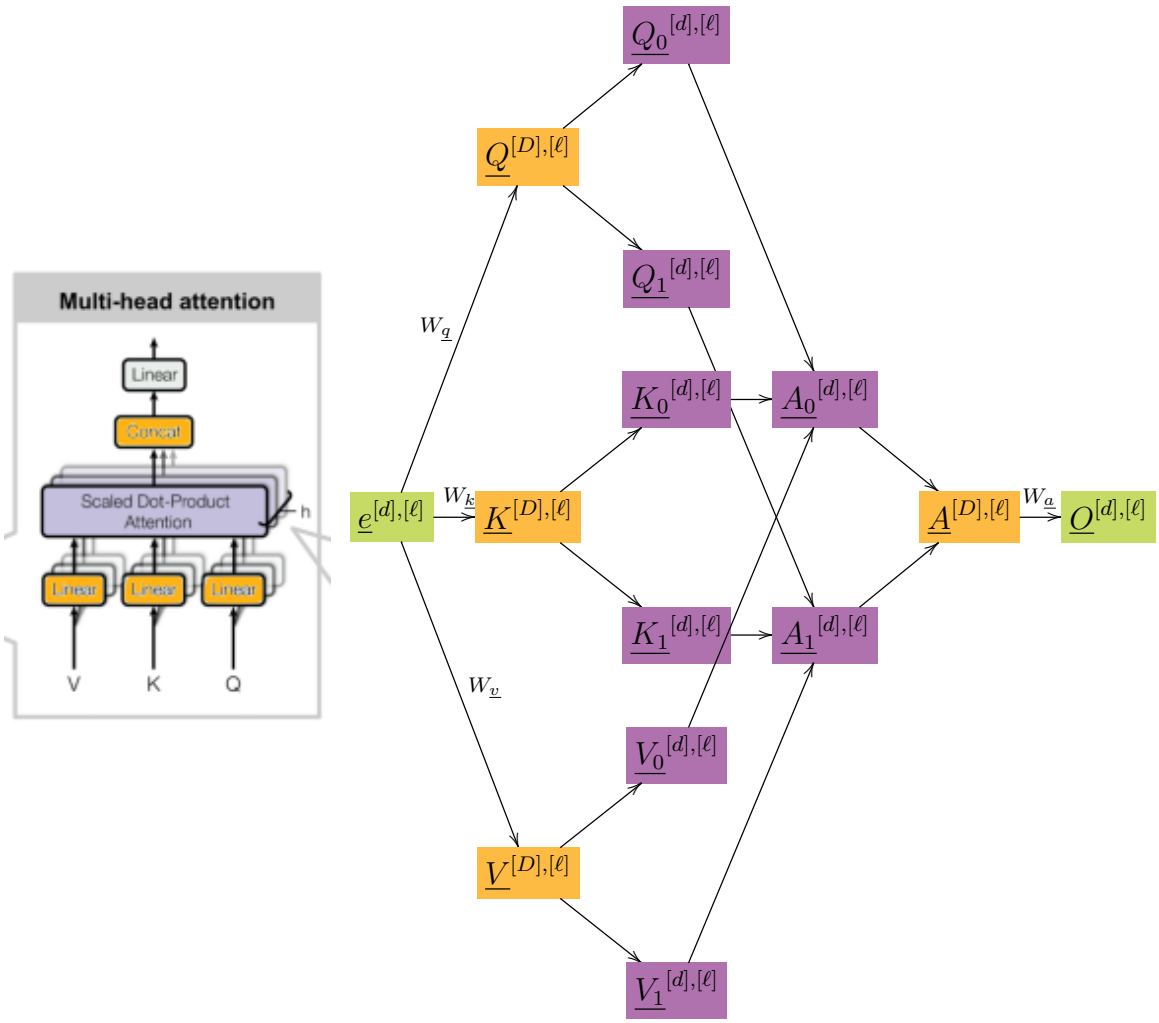

Figure 95.7: Multi-head Attention with 2 heads. Note that the orange nodes all have the same tensor shape.

$$K_1^{[d],[\ell]} = \text{linear}(K^{[D],[\ell]}) \text{ (split, then project a component)} \tag{95.48f}$$

$$O^{[d],[\ell]} = W_{\underline{a}}^{[d],[D]} A^{[D],[\ell]} \tag{95.48g}$$

$$Q^{[D],[\ell]} = W_{\underline{q}}^{[D],[d]} e^{[d],[\ell]} \tag{95.48h}$$

$$Q_0^{[d],[\ell]} = \text{linear}(Q^{[D],[\ell]}) \text{ (split, then project a component)} \tag{95.48i}$$

$$Q_1^{[d],[\ell]} = \text{linear}(Q^{[D],[\ell]}) \text{ (split, then project a component)} \tag{95.48j}$$

$$V^{[D],[\ell]} = W_{\underline{v}}^{[D],[d]} e^{[d],[\ell]} \tag{95.48k}$$

$$V_0^{[d],[\ell]} = \text{linear}(V^{[D],[\ell]}) \text{ (split, then project a component)} \tag{95.48l}$$

$$V_1^{[d],[\ell]} = \text{linear}(V^{[D],[\ell]}) \text{ (split, then project a component)} \tag{95.48m}$$

$$e^{[d],[\ell]} = \text{ prior} \tag{95.48n}$$

95.3.3 Encoder

Fig.95.8 gives a bnet representation of the “Encoder" portion of Fig.95.4. The structural equations for that bnet, printed in blue, are as follows.

$$A^{[D],[\ell]} = \text{Attention}(Q^{[D],[\ell]}, K^{[D],[\ell]}, V^{[D],[\ell]}) \tag{95.49a}$$

$$e^{[d],[\ell]} = \mathcal{E}^{[d],[L]} x^{[L],[\ell]} \tag{95.49b}$$

$$F^{[d],[\ell]} = \text{feed\_forward\_nn}(N^{[d],[\ell]}) \tag{95.49c}$$

$$K^{[D],[\ell]} = W_{\underline{k}}^{[D],[d]} e^{[d],[\ell]} \tag{95.49d}$$

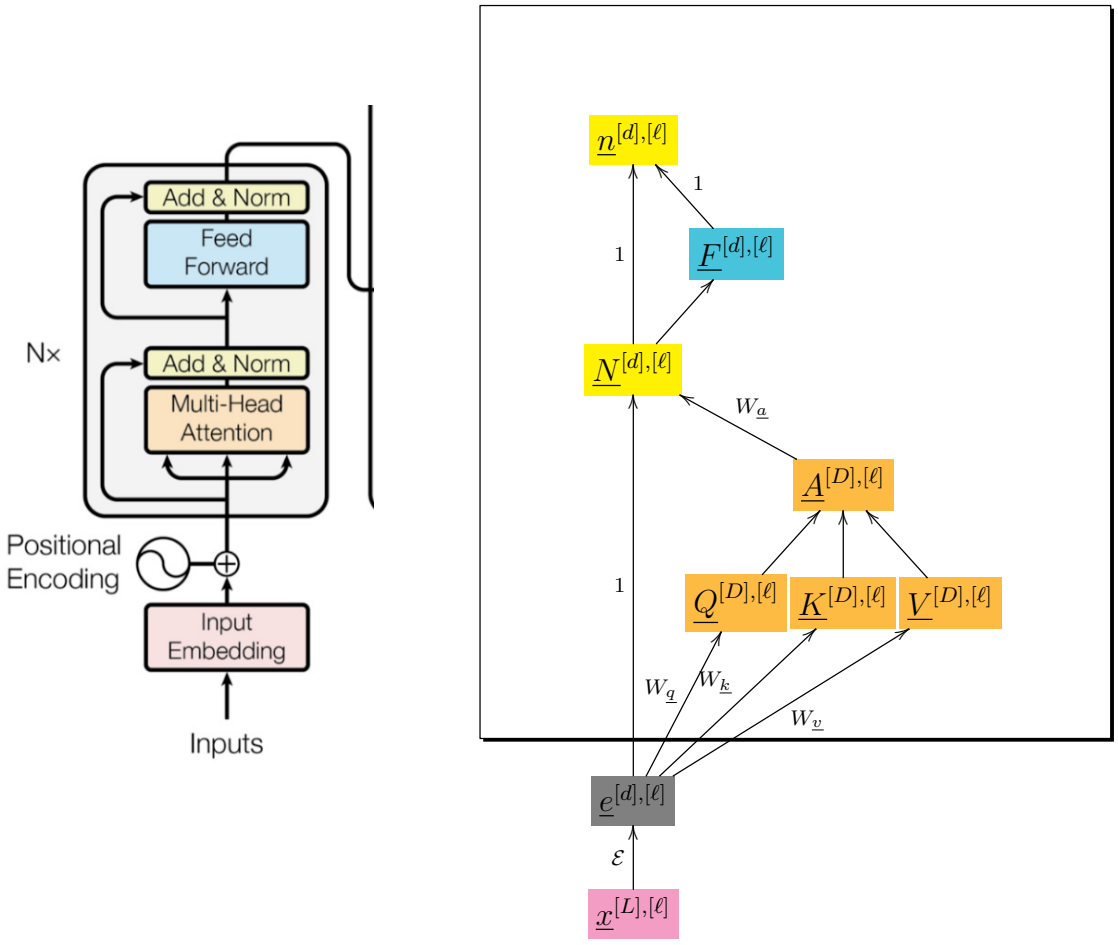

Figure 95.8: Encoder of Vanilla Transformer Net. Λ copies of the boxed part are connected in series.

$$n^{[d],[\ell]} = \text{normalize}(N^{[d],[\ell]} + F^{[d],[\ell]}) \tag{95.49e}$$

$$N^{[d],[\ell]} = \text{normalize}(e^{[d],[\ell]} + W_{\underline{a}}^{[d],[D]} A^{[D],[\ell]}) \tag{95.49f}$$

$$Q^{[D],[\ell]} = W_{\underline{q}}^{[D],[d]} e^{[d],[\ell]} \tag{95.49g}$$

$$V^{[D],[\ell]} = W_{\underline{v}}^{[D],[d]} e^{[d],[\ell]} \tag{95.49h}$$

$$x^{[L],[\ell]} = \text{ prior} \tag{95.49i}$$

95.3.4 Decoder

Fig.95.9 gives a bnet representation of the "Decoder" portion of Fig.95.4. The structural equations for that bnet, printed in blue, are as follows.

$$a^{[D],[\ell]} = \text{Attention}(v^{[D],[\ell]}, k^{[D],[\ell]}, q^{[D],[\ell]}) \tag{95.50a}$$

$$A^{[D],[\ell]} = \text{Attention}(Q^{[D],[\ell]}, K^{[D],[\ell]}, V^{[D],[\ell]}) \tag{95.50b}$$

$$e^{[d],[\ell]} = \mathcal{E}^{[d],[L]} x^{[L],[\ell]} \tag{95.50c}$$

$$F^{[d],[\ell]} = \text{feed\_forward\_nn}(j^{[d],[\ell]}) \tag{95.50d}$$

$$I^{[L],[\ell]} = W_{fin}^{[L],[d]} Y^{[d],[\ell]} \tag{95.50e}$$

$$j^{[d],[\ell]} = \text{normalize}(U_{\underline{a}}^{[d],[D]} a^{[D],[\ell]} + J^{[d],[\ell]}) \tag{95.50f}$$

$$J^{[d],[\ell]} = \text{normalize}(W_{\underline{a}}^{[d],[D]} A^{[D],[\ell]} + e^{[d],[\ell]}) \tag{95.50g}$$

$$K^{[D],[\ell]} = W_{\underline{k}}^{[D],[d]} e^{[d],[\ell]} \tag{95.50h}$$

$$k^{[D],[\ell]} = U_{\underline{k}}^{[D],[d]} n^{[d],[\ell]} \tag{95.50i}$$

$$n^{[d],[\ell]} = \text{ Prior coming from Encoder.} \tag{95.50j}$$

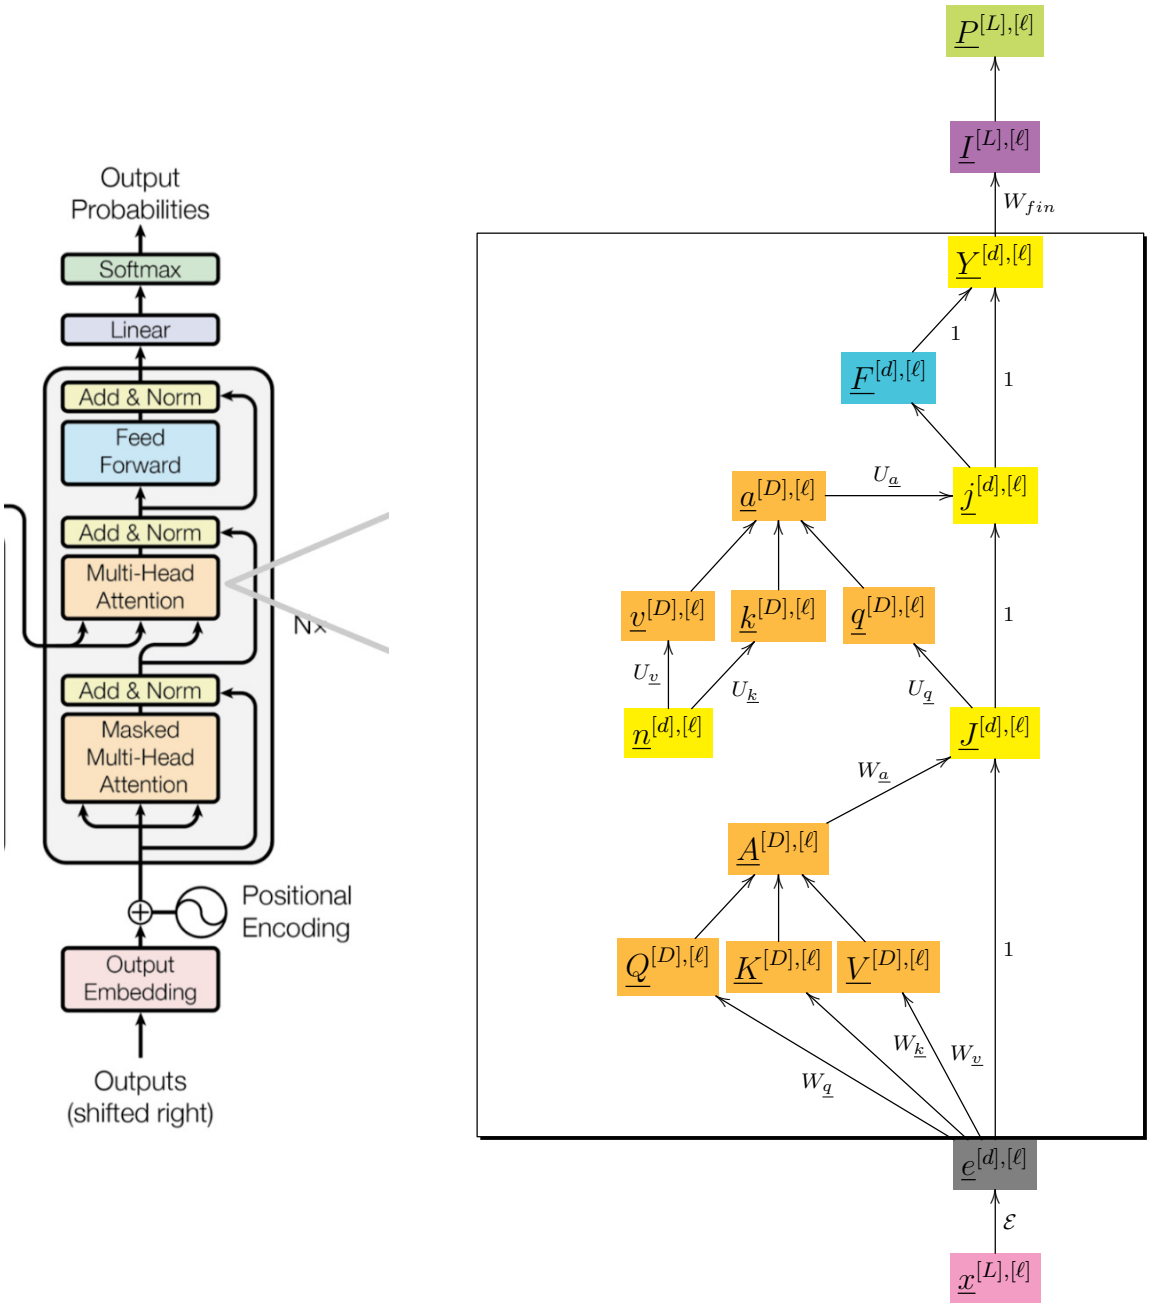

Figure 95.9: Decoder of Vanilla Transformer Net. Λ copies of the boxed part are connected in series.

$$P^{[L],[\ell]} = \text{softmax}(I^{[L],[\ell]}) \quad (\sum_{\alpha\in[\ell]} P^{[L],\alpha} = 1) \tag{95.50k}$$

$$q^{[D],[\ell]} = U_{\underline{q}}^{[D],[d]} J^{[d],[\ell]} \tag{95.50l}$$

$$Q^{[D],[\ell]} = W_{\underline{q}}^{[D],[d]} e^{[d],[\ell]} \tag{95.50m}$$

$$V^{[D],[\ell]} = W_{\underline{v}}^{[D],[d]} e^{[d],[\ell]} \tag{95.50n}$$

$$v^{[D],[\ell]} = U_{\underline{v}}^{[D],[d]} n^{[d],[\ell]} \tag{95.50o}$$

$$x^{[L],[\ell]} = \text{ prior, right shifted output} \tag{95.50p}$$

$$Y^{[d],[\ell]} = \text{normalize}(F^{[d],[\ell]} + J^{[d],[\ell]}) \tag{95.50q}$$

95.4 BERT

I used the the Wikipedia article on BERT, Ref[94] to write this section.

BERT (Bidirectional Encoder Representations from Transformer) is a realization of the Encoder half of the Vanilla tranet. One can either add a smaller NN to the output of BERT (this is called **fine-tuning**), or one can add a de-embedding layer to its output so that the total device takes word lists to word lists.

In the language of Bayesian Networks, fine-tuning is the same as using BERT as a prior probability. See Chapter 84 on sentence splitting for an example of BERT fine-tuning.

95.4.1 BERT parameter values

BERT comes in two sizes, base and large. See Table 95.1 for a listing of some BERT parameter values.

	BERT base	BERT large
ℓ, context window	512	512
L, `vocab_size`	30,522	30,522
d, `hidden_size`	768	1024
$n_{\underline{h}}$, `num_attention_heads`	12	16
Λ, `num_hidden_layers`	12	24
D', `intermediate_size`	3,072	3,072
number of parameters	110M	340M

Table 95.1: Some hyper-parameter values for BERT base and BERT large

95.4.2 BERT Embedding

So far, we have described the embedding step as a single step from tokenization into words, to 1 hot vectors, to embedding vectors. There are other additional steps in the embedding process that we haven't described so far (namely, tokenization into subwords, adding special tokens, and padding). We would like to describe those additional steps now, in the context of the BERT model. Here is an example.

Let's consider a short sentence: "The cat is on the mat."

1. **Tokenization into words:** Tokenize the sentence into individual words:

   "The", "cat", "is", "on", "the", "mat", "."

2. **Tokenization into subwords:** Further tokenize words into subword units using WordPiece tokenization or a similar method. For example:

$$
\begin{aligned}
&The \rightarrow The \\
&cat \rightarrow ca, t \\
&is \rightarrow is \\
&on \rightarrow on \\
&the \rightarrow the \\
&mat \rightarrow mat \\
&. \rightarrow .
\end{aligned}
$$

   Any subword not appearing in BERTs vocabulary is replaced by [UNK] for "unknown".

3. **Adding Special Tokens:** Add special tokens, such as [CLS] (classification) at the beginning and [SEP] (separator) at the end:

   "[CLS]", "The", "ca", "t", "is", "on", "the", "mat", ".", "[SEP]"

4. **Padding:** If necessary, pad or truncate the sequence to a fixed length. Add padding tokens "[PAD]" to reach a specified sequence length.

5. **Embedding Matrix:** Create a tensor with 1-hot columns

$$x^{\beta,\alpha} = \delta(\beta, \beta(\alpha)) \tag{95.51}$$

where $\alpha \in [\ell]$, $\beta \in [L]$ and where $\beta(\alpha)$ is the location in the BERT vocab corresponding to token α in the the padded string. Now multiply x times the previously discussed embedding matrix $\mathcal{E}$ to get

$$e^{[d],[\ell]} = \mathcal{E}^{[d],[L]} x^{[L],[\ell]} \in \mathbb{R}^{d \times \ell} \tag{95.52}$$

This gives a vector in $\mathbb{R}^d$ for each token α in the padded string. The matrix $\mathcal{E}$ is pre-trained and captures contextual information and word similarities. It can also include positional embedding, as discussed before.

95.4.3 BERT training

BERT was trained[6] simultaneously on two tasks.[7]

1. **language modeling**: 15% of tokens were selected for prediction. Those tokens selected for prediction were replaced by the [MASK] token 80% of the time, by a random word 10% of the time, and not replaced at all 10% of the time. The training objective was to predict the selected token given its context.

2. **next sentence prediction:** Given two spans of text, the model predicts if these two spans appeared sequentially in the training corpus, outputting either [IsNext] or [NotNext]. For example,

   - Given "[CLS] my dog is cute [SEP] he likes playing" the model should output token [IsNext].
   - Given "[CLS] my dog is cute [SEP] how do magnets work" the model should output token [NotNext]

[6] Sometimes this is called “pre-training" to distinguish it from the “training" of the smaller NN that is attached to the output of BERT when doing fine-tuning.

[7] This section on BERT training quotes Wikipedia Ref.[94] heavily.
